

Table of contents

List of figures	v	Poor interface with other sectors	27
List of acronyms	v	Overall perspectives on the QMS	28
Executive summary	vi	Management of other harvest sectors	28
Preface	xi	Māori non-commercial customary fishing	29
International assessments	xi	Recreational fishing	29
Purpose and methodology	xii	3 Setting harvest levels	31
Report structure	xiii	The concept of MSY	32
Acknowledgements	xiv	Application of MSY in New Zealand	35
1 The importance of fisheries management	1	Assessing stock size	38
Cultural importance	2	Use of fisheries models	42
Recreational importance	2	CPUE	43
Commercial importance	3	The TAC and TACC	45
Non-extractive use importance	3	Setting the TAC and TACC	46
Environmental importance	4	Adjusting the TAC and TACC	51
The fisheries management challenge	5	Decision rules	56
2 Fisheries management system	7	Voluntary shelving ACE	57
Emergence of the quota management system (QMS)	8	4 Ensuring healthy marine environments	59
Key elements of a QMS	9	Evolution of ecosystem-based fisheries management (EBFM)	60
Application of a QMS to New Zealand's fisheries	10	From EBFM to 'ecosystem-based management'	62
Allocation of rights	11	Application of EBFM in New Zealand	64
Stocks and QMAs	12	Historic habitat damage	64
ITQ and ACE	16	Legislative approach	66
Catch balancing	17	Essential fish habitat	68
User pays	17	Environmental policy and standards	68
Self-management	19	Conservation services programme	69
Māori fisheries settlement	21	Aquatic Environment Working Group	70
Potential problems with a QMS	24	Case studies of habitat loss	72
Setting the wrong harvest cap	24	Trawling damage to snapper habitat in Tasman and Golden Bays	72
Illegal discarding	24	Loss of shellfish habitat in Tasman and Golden Bays	74
Imbalances with mixed-species fisheries	25	Habitat degradation in the Marlborough Sounds	77
High management costs	25	Trophic cascades on the northeast coast	82
Environmental impacts	25	Protection and enhancement	86
Social impacts	26	Innovative technologies to reduce habitat impacts	87

5 Supporting a thriving fishing industry	93		
Restructuring of fishing industry	94	Resolving the devolution issue	143
Aggregation of quota	96	Developing a pragmatic fisheries management approach	144
Uncertain access to the fishery	97	Broadening fisheries-related information	144
Redistribution of value of the landed fish	99	Improving decision-making processes	144
Attrition of the independent fleet	102	Strengthening the policy and planning framework	144
Increasing the value of fish	107	Applying spatial management at the appropriate level	144
6 Making good fisheries management decisions	111	Environmental matters	145
Fisheries management agency	112	Addressing the impacts of fishing on benthic habitats	145
Loss of institutional knowledge	112	Protecting coastal habitats of importance to fisheries	145
Ideologically driven	114	Integrating management	145
Unclear fisheries management role	115	Implementing EBFM in New Zealand	146
Reactive rather than proactive	116	Fisheries ecosystem planning	146
Ossification of the system	118	Marine spatial planning	149
Fisheries decision-making processes	119	Integrating ecosystem planning approaches	151
High level of politicisation	120	References	155
Poor conflict resolution procedures	121	Endnotes	161
Unsuccessful multistakeholder decision-making processes	122	Index	163
Lack of social consensus	127		
Fisheries planning	128		
Broad-based regional fisheries planning	129		
Devolved fisheries planning	131		
Ministry-led fisheries planning	132		
Fisheries management tools	133		
Interface with other resource management regimes	137		
7 The way forward	141		
Big picture issues	142		
Resolving the underpinning issues	142		
Addressing market and access issues	143		
Building constructive dialogue and social capital	143		
Fisheries management	143		
Rebuilding fisheries management capacity	143		
Supporting a culture of reflexion	143		

List of figures

2.1	Key elements of a QMS	9
2.2	Key elements of New Zealand's fisheries management system	10
2.3	Map of New Zealand FMAs	13
2.4	Misalignment between QMS stocks and biological stocks in the Hauraki Gulf	14
2.5	Summary of potential strengths and weaknesses of an ITQ system	27
3.1	Schaefer curve	33
3.2	Models for setting target stocks	37
3.3	Known status of finfish stocks in the Hauraki Gulf	40
3.4	The relationship between TAC, TACC and ACE	45
3.5	Initial and current TACCs compared to harvest for Hauraki Gulf finfish stocks	46
3.6	Undercaught fish stocks in Area 1	49
3.7	Changes in TACCs for Hauraki Gulf finfish stocks	54
4.1	Initiatives to reduce fisheries bycatch of protected species	70
6.1	Fisheries management agencies in New Zealand	112
6.2	Evolution of fisheries planning	129
6.3	Marlborough Sounds blue cod recreational fishing management	135
6.4	Agency responsibilities for managing the interface of fisheries with the marine environment	137
7.1	Steps to develop a fisheries ecosystem plan	147
7.2	Conceptual framing of ecosystem planning within the marine management system	152

List of acronyms

ACE	annual catch entitlements
B0	virgin (unfished) biomass
CAY	constant annual yield
CPUE	catch per unit effort
CSO	commercial stakeholder organisation
DOC	Department of Conservation
EAF	ecosystems approach to fisheries
FAO	Food and Agricultural Organization of the United Nations
FMA	fisheries management area
FTE	full-time equivalent
IQ	individual quota
ITQ	individual transferable quota
MAF	Ministry of Agriculture and Fisheries
MCY	maximum constant yield
MEY	maximum economic yield
MPI	Ministry for Primary Industries
MSY	maximum sustainable yield
NIWA	National Institute of Water and Atmospheric Research
QMA	quota management area
QMS	quota management system
RMA	Resource Management Act 1991
SEA	strategic environmental assessment
TAC	total allowable catch
TACC	total allowable commercial catch
TOKM	Te Ohu Kaimoana
TURF	territorial user rights fishery
